

CNMT 210 Fall 2015 Final Project - Template

Create a basic template file that can be used as the basis from which other pages will be built.

The basic template should contain the JavaScript shiv and a link to an external stylesheet, along with any other basic HTML elements, such as:

HTML Element and Body

An html element that is 100% of the width and height.

A body section that is centered and consumes only a certain portion of the display and also contains a sidebar. The body should have a minimum width, which can be decided upon and defined by you.

Header and Nav

A header with a navigational element such as a horizontal navbar/menu containing space for at least four links. You can choose a vertical nav structure as well. If you choose to use an unordered list, bullets should not appear.

A logo or other image used for branding the site should also appear in the header. See <http://www.dummyimage.com> for a simple image creation site.

The nav should change into a hamburger menu when viewed in smaller viewports and the logo should still appear.

The entire header should be visually appealing in both mobile and desktop versions. Remember when choosing your layout: Mobile first or desktop first?

Sidebar

Many pages will feature a sidebar. The sidebar should disappear (or be placed vertically below the main content) in smaller viewports, such as those below 481px.

Footer

A footer containing copyright information with your name. This information should be bolded and right-justified for all viewports except viewports smaller than 481px. In small viewports, this information should be centered.
