

CNMT 210 Fonts and Lists Assignment

Points: 5

Due Date: October 1, 2015, at the end of lab

For this assignment, you'll create a valid HTML5 web page that contains a web font that is appropriate for a heading. The web font should be loaded using the Google Font method or via @font-face. You can use an in-page style or external style sheet but no inline styles.

The page should contain the following (one point for each bullet):

- A heading with your name, styled with your web font choice.
- Three unordered lists, with each list styled with different "bullet" styles. The lists should contain at least two items each (you choose the content).
- All three of the lists should be colored in some color of your choice, each using a 80% alpha value (rgba). - You must use **only one** CSS style/rule for this to receive credit. Use of two or more style rules, or a rule for each list, will not earn the point.
- The lists should be a larger-than-default font size, but not larger than the heading. Again, use one style rule for this purpose.
- Valid HTML & CSS. Files and folder names should all be lowercase with no spaces or special characters. Note, if you use a Google font you may receive a validation error related to the URL that Google builds. This error, if solely related to the Google URL, is acceptable.

This assignment should be turned in on D2L as a zip file containing the following:

Your .html file (and your external CSS, if you used one).

Screenshot of HTML validation.

Screenshot of CSS validation.

Screenshot of the page.

Even if you show the assignment to me in lab, it should still be turned in on D2L.
