

CNMT 210 JavaScript Forms Validation

Points: 15

Due Date: 12/8/2015 12:00pm Central Time

This assignment is to validate a form using JavaScript. Specific things that you will need to do include adding an event handler to the submit event of the form and then calling another function to validate three text inputs. One text input should be a phone number and should validate according to the criteria below. The other two fields should be password fields and these should be validated to ensure they match each other as well as criteria below. The page should react appropriately when the form is invalid.

Specific form criteria:

- A text input for a phone number with the format NNN-NNN-NNNN.
- The password inputs should be an appropriate input type for passwords, should match each other, and should allow all characters.
- The password inputs must be at least 8 characters in length and no more than 15 characters in length.
- Other than styles to indicate validation failure, no styling is needed for the form or page but it should be valid HTML.

Bonus assignment points may be awarded for accepting NNNNNNNNNN for a phone number and adding the dashes in the appropriate places.
